Key Expiration

SWIPE

BY

ARPIT BHAYANI

How Redis expires the keys

In Redis, we can set expiry to keys

```
EXPIRE k 10
```

Expire the key 'k' in '10' seconds

- no burden for manual del
- no memory leaks
- naturally fits in real products

Anyone trying to access the key after 10 seconds would get a 'nil'

Passive mode

A key is passively expired when some client tries to access it, and the key is found to be expired.

What about keys that are never accessed?

Active mode

10 times every second

1. test random keys having some Exp set
2. delete keys that are found to be expired
3. if more than 25% keys were expired, repeat

Sample is representative of population. if sample has more than 25% expired key, population would have the same proportion.
