Signal Handling and Graceful Termination

What happens when you CTRL + C ?

↳ The database shuksdown

Shutdown should always be graceful, but how ?

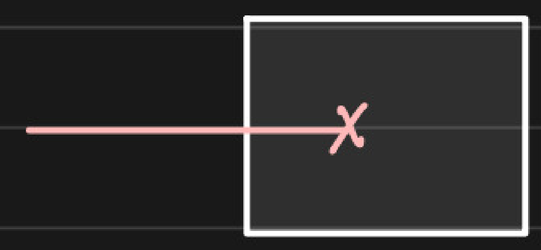

Signal Handling

Signals are notifications sent by Kernels to the process so that process can handle them and do the needful

This way, the database can ensure

↳ proper closure

↳ data integrity and consistency

* There are different signals for different purposes

SIGTERM and SIGINT

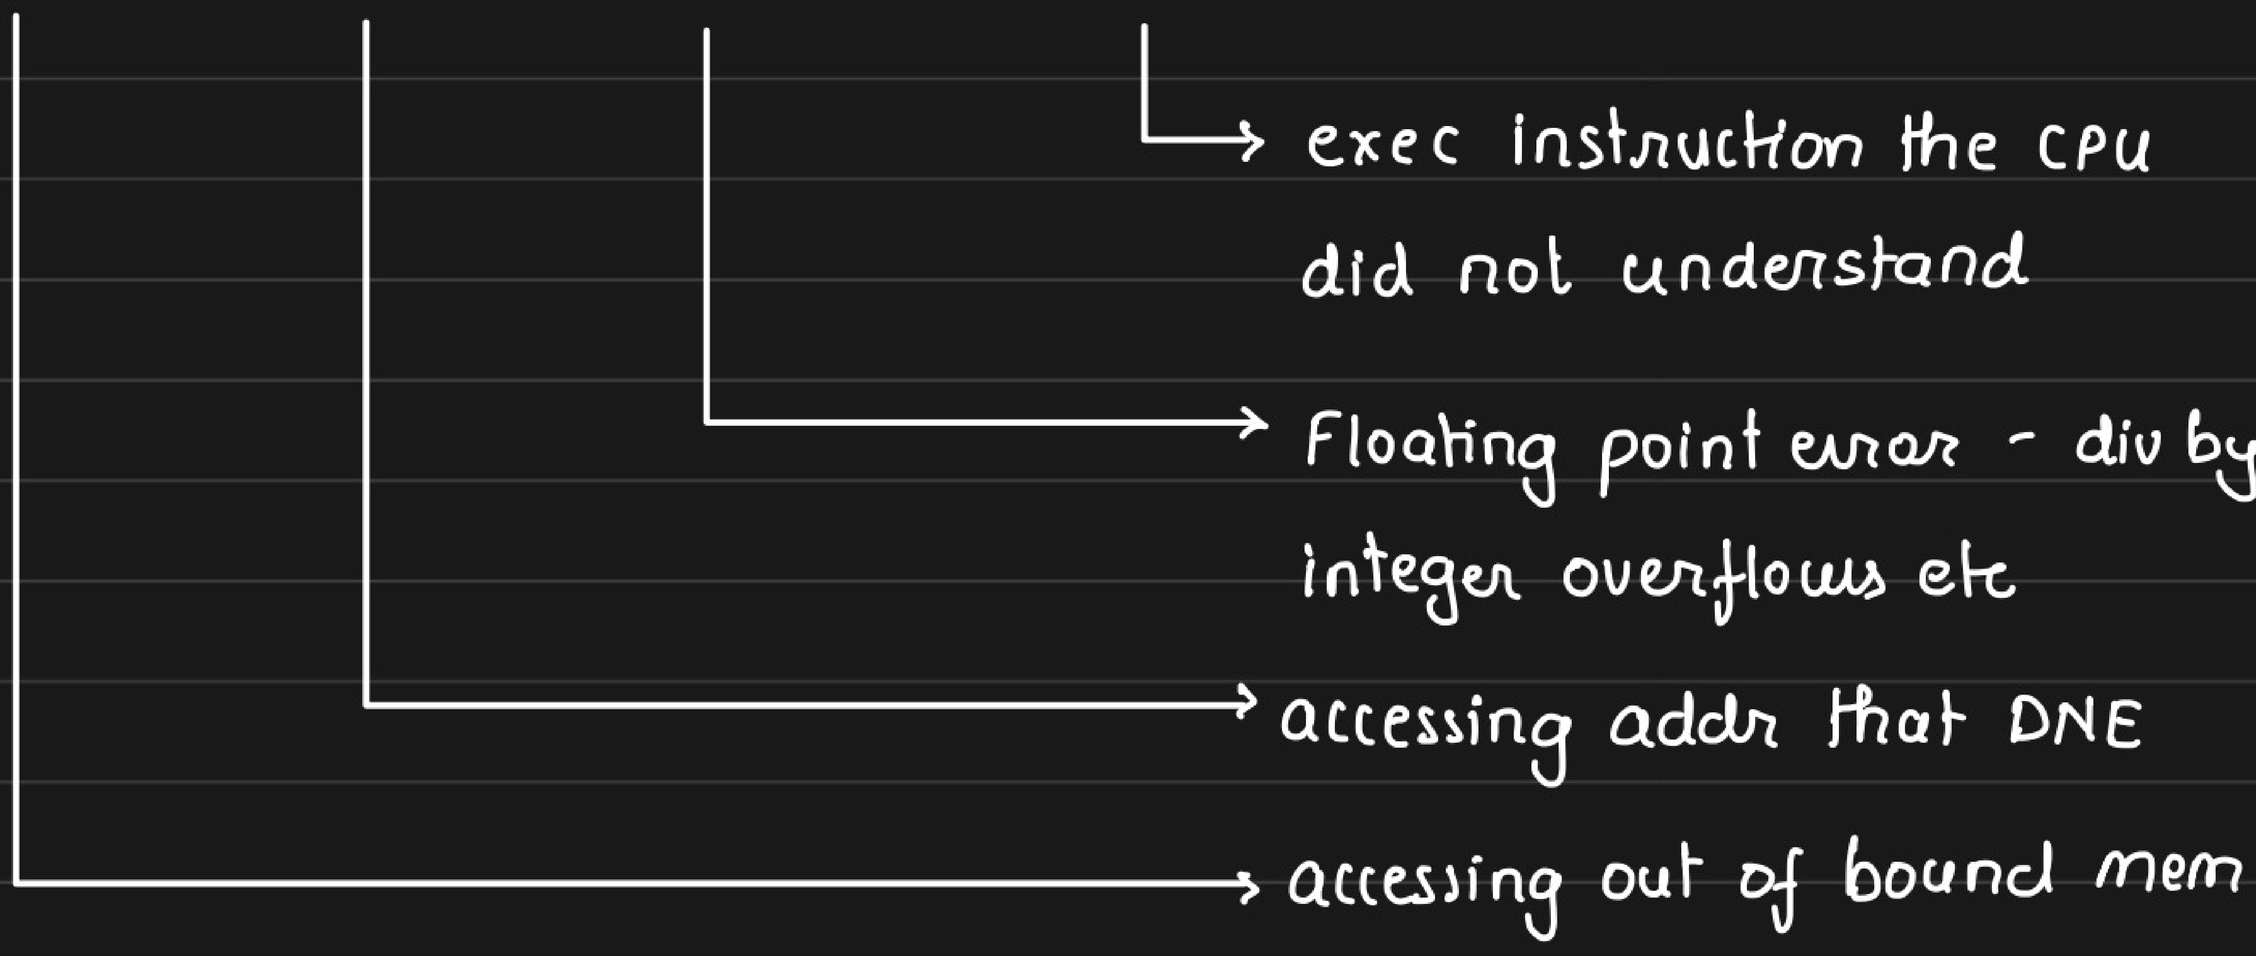

↳ tells Redis to shutdown gracefully

↳ it does cleanup
↳ file flushed
↳ socket closed
↳ data persisted (config)

} Ensures existing commands completes their execution

ARPIT BHAYANI

SIGSEGV, SIGBUS, SIGFPE and SIGILL

When any of above signals are trapped, Redis dumps all the information - stack trace, registers, state of client to the disk

SIGHUP and SIGPIPE

Redis ignores them.
